

10 Gigabit Optical Module Transmit Power

Overview

Cisco 10GBASE SFP+ Modules Data Sheet This feature gives the end user the ability to monitor real-time parameters of the SFP, such as optical output power.

Key Takeaways

Typical 10G SFP+ optical modules have transmit power ranging from approximately -7 dBm to +3 dBm, depending on the module type and distance. Overview of 10G Optical Modules

10 Gigabit Ethernet optical modules, such as 10GBASE-LR, 10GBASE-SR, and 10GBASE-ER, are designed for different fiber types and link distances. The transmit power is a key parameter that determines the maximum achievable distance and ensures reliable signal reception at the far end of the fiber link .

- 10GBASE-LR (Long Reach): Operates at 1310 nm over single-mode fiber (SMF) with a typical link distance of up to 10 km. The transmit power for these modules usually ranges from -7 dBm to -1 dBm, with an optical receiver sensitivity around -11 dBm .
- 10GBASE-SR (Short Reach): Operates at 850 nm over multimode fiber (MMF) for distances up to 300-400 meters on OM3/OM4 fiber. Transmit power is generally higher, around -7 dBm to -3 dBm, to accommodate shorter distances and higher modal dispersion .

- **10GBASE-ER (Extended Reach):** Operates at 1550 nm over SMF for distances up to 40 km. These modules have higher transmit power, typically 0 dBm to +3 dBm, to overcome fiber attenuation over long distances .

Key Features Affecting Transmit Power

- **Automatic Power Control (APC):** Many SFP+ modules include APC circuits to maintain consistent optical output across temperature and voltage variations .
- **Transmit Fault and Disable Pins:** Modules provide TX_Fault and TX_Dis signals to monitor and control laser operation, ensuring safety and preventing over-power conditions .
- **Limiting vs Non-Limiting Modules:** Some modules, like 10GBASE-LR, use limiting receivers to maintain signal integrity, which affects the required transmit power for reliable operation .

Practical Considerations

When designing a 10G optical link, consider:

- **Fiber type and quality:** SMF vs MMF, OM3/OM4 ratings.
- **Link distance:** Ensure transmit power and receiver sensitivity meet the optical budget.
- **Connector and splice losses:** Include in the link budget calculation.
- **Environmental factors:** Temperature and voltage variations can slightly affect output power. By selecting the appropriate module type and verifying the transmit power against the link budget, network engineers can ensure reliable 10G connectivity across the intended distance .
