

Anti-tracking communication power supply system for campus network use

Overview

These are three of the many telecommunication power supply applications that challenge power system designers to analyze a wide range of power distribution architectures and converter topologies.

Key Takeaways

A secure, centralized power supply system using hybrid fiber and PoE distribution, combined with robust network management, can provide reliable campus-wide connectivity while minimizing tracking vulnerabilities.

Centralized Power Distribution

For campus networks, a centralized power supply simplifies deployment and enhances security. Solutions like Powered Fiber Cable Solution (PFCS) allow both DC power and optical fiber signals to be delivered through a single cable, reducing the need for multiple conduits, transformers, or remote UPS units. This approach supports devices such as Wi-Fi access points, IP cameras, and small cells up to 3 km away, while keeping the infrastructure discreet and less susceptible to physical tampering or tracking.

Power Supply Topologies High-efficiency DC-DC converters and Point-of-Load (POL) modules are recommended for campus network devices. These can operate from a -48V distribution bus or a +12V intermediate bus, providing multiple low-voltage outputs for analog and digital circuits. Using redundant (N+1) converters ensures fault tolerance, heat distribution, and longer lifecycle, which is critical for continuous campus network operation.

Secure Communication Integration

To reduce tracking risks, communication over the power supply network can be secured using Powerline Communication (PLC) protocols with error detection, retransmission, and CSMA schemes. These protocols support bidirectional communication and multiple masters, ensuring reliable data transfer while minimizing the risk of interception. For additional security, network management platforms like imVision can monitor all connections in real time, detect anomalies, and issue automated alerts for potential breaches.

Anti-

Tracking Considerations

Centralized Power and Fiber Distribution: Minimizes the number of exposed devices and cables, reducing physical tracking opportunities. Encrypted Communication: Use secure PLC or PoE protocols with encryption to prevent eavesdropping. Automated Infrastructure Management: Real-time monitoring of device connections and changes helps detect unauthorized access or tampering.

Redundant and Isolated Power Supplies: Using N+1 redundancy and isolated DC-DC converters ensures that power failures or tampering do not compromise network security.

Implementation Strategy

Deploy hybrid fiber and power cables to all campus endpoints. Use high-efficiency DC-DC converters with load sharing for critical devices. Integrate secure PLC or PoE communication protocols for data transfer.

Implement centralized network management to monitor, log, and control all devices. Regularly audit and update firmware and encryption keys to maintain anti-tracking integrity. By combining centralized, redundant power distribution with secure communication protocols and real-time network management, campus networks can achieve reliable operation, energy efficiency, and reduced tracking risk.

Communications System Power Supply Designs

These are three of the many telecommunication power supply applications that challenge power system designers to analyze a wide range of power distribution architectures and converter topologies.

Telecom Power System, Rectifier System, BTS Power

Ensure seamless telecom operations with our Outdoor Telecom Power System, designed for remote and harsh environments. Featuring intelligent power

Power supplies with communication interface

PULS power supplies with an integrated EtherCAT ports can be connected directly to EtherCAT controllers – without the need for additional gateways, providing easy and rapid access to all

Communications in power system protection (medias, protocols and

It is capable of establishing network communications not only for power system applications, but also for factory automation, process control, building networks, vehicle networks etc.

TECHNICAL REQUIREMENTS FOR THE ELECTRICAL SAFETY OF

This section specifies the operating environment and anti-tracking function of a power plug with a rated current less than or equal to 20 A at rated voltages of 125 V or 250 V for 2 pole and 2

Discussion on the Management of Special Power Supply System for

This paper describes the status of the power supply dedicated to power communication, analyzes the operation mode and typical architecture of the power supply dedicated to power

Design and Application Analysis of Communication Power Supply ...

If a power failure is not addressed in a timely manner, it will affect the normal operation of the communication system. Therefore, it is necessary to monitor and manage the communication power

Typical Networking Architectures for Campus Networks and ...

Typical LAN technologies used in the campus network include Ethernet technology (wired) following the IEEE 802.3 standard and Wi-Fi technology (wireless) following the IEEE 802.11

AntCom: An effective and efficient anti-tracking system with dynamic ...

We present AntCom, an effective and efficient communication system that provides low latency and high tracking-resistance. AntCom improves the tracking-resistance of communication via

An IoT system for a smart campus: Challenges and solutions

Various devices and systems were integrated into the system and five real-world scenarios in a university campus environment are used to illustrate the challenges encountered.
