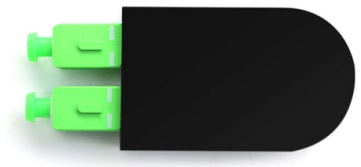
How many DHCP servers can a core switch be configured with



Overview

Before configuring the DHCP relay agent on your switch, make sure to configure the device that is acting as the DHCP server.

Key Takeaways

A core switch can be configured with multiple DHCP servers, but the practical number depends on network design, VLANs, and switch capabilities.

Configuring DHCP on a Core Switch

A core switch can act as a DHCP server itself or relay DHCP requests to other servers. Technically, there is no strict limit on the number of DHCP servers that can be configured on a switch, but practical constraints exist due to memory, CPU, and the number of IP pools the switch can manage . For example, Cisco IOS-XE switches like the C9200 series can handle multiple DHCP pools, but very large pools may cause performance issues .

Multiple VLANs and DHCP

You do not need a separate DHCP server for each VLAN. A single DHCP server can serve multiple VLANs if the switch or router is configured as a DHCP relay agent (using the ip helper-address command) to forward requests across subnets . Each VLAN typically has its own DHCP pool, and the switch can manage multiple pools simultaneously. Care must be taken to avoid overlapping IP ranges and to ensure proper routing of DHCP requests.

Redundancy and Multiple DHCP Servers

For redundancy or load balancing, you can deploy multiple DHCP servers on the same network. They can either serve different subnets or share the same subnet with split address ranges to prevent conflicts . When multiple servers serve the same subnet, careful planning is required to avoid IP address collisions and ensure consistent lease management. Core switches can be configured to trust DHCP messages from multiple servers when DHCP snooping is enabled .

Best Practices

• Limit the size of DHCP pools on the switch to avoid performance degradation .

• Use DHCP relay for VLANs that are not directly connected to the DHCP server .

• Avoid overlapping IP ranges when multiple DHCP servers are used .

• Store DHCP binding databases externally if the switch has limited memory .

In summary, a core switch can support multiple DHCP servers and multiple pools, but the exact number depends on the switch model, memory, and network design. Proper planning ensures efficient IP address allocation, redundancy, and network stability.
