

Are SC cold joints useful

Overview

These joints are considered undesirable because they can compromise the structural integrity of the concrete, leading to reduced strength, durability, and potential water infiltration. Cold joint concrete represents a significant challenge in the construction industry, potentially leading to critical structural weaknesses if not addressed appropriately. The delayed placement prevents full integration and knitting between the concrete batches and might lead to reduced structural robustness, increased. Cold joints in concrete occur when a new layer of concrete is placed against a previously hardened layer that was not properly prepared, resulting in a weak bond between the two surfaces. However, its performance largely.
