How to cut fiber optic pigtail ends

Overview

How To Terminate Fiber Optic Cable: ConnectorsLearn how to terminate fiber optic cable using mechanical connectors or fusion splicing. We Fiber Optic Pigta.

Key Takeaways

Cutting the end of a fiber optic pigtail requires precision using a fiber cleaver to ensure a clean, perpendicular cut for optimal splicing.Preparation

Before cutting, gather the necessary tools: a fiber stripper, fiber cleaver, isopropyl alcohol wipes, and protective eyewear. Work in a clean, dust-free environment to prevent contamination, as even small particles can degrade signal quality .

Stripping the Fiber
• Remove the outer jacket of the pigtail carefully using a fiber stripper, exposing the bare glass fiber.

• Strip only the required length, typically a few centimeters, to avoid unnecessary fiber exposure.

• Clean the exposed fiber with an alcohol wipe to remove any coating residue or dust .
Cleaving the Fiber
• Place the cleaned fiber into a precision fiber cleaver.

• Align the fiber according to the cleaver's guide to ensure a perpendicular cut.

• Activate the cleaver to make a clean, smooth cut. A proper cleave is critical for low-loss fusion splicing .
Post-Cut Handling
• Avoid touching the freshly cleaved fiber with your fingers.

• Inspect the fiber end under a microscope if available to ensure the cut is smooth and free of chips or cracks.

• Immediately proceed to fusion splice the pigtail to the main fiber or use a mechanical splice, depending on your installation method .
Tips for Success
• Always use high-quality, pre-tested pigtails to reduce errors.

• Keep tools clean and sharp; dull cleavers or dirty tools can cause poor cuts and signal loss.

• Handle fiber scraps carefully; they are sharp and can cause injury . By following these steps, you ensure a reliable, low-loss connection when splicing fiber optic pigtails in data centers, FTTH installations, or telecom networks .
