

Automatic power cut-off of distribution box and meter

Overview

This document describes an automatic cut-off electric meter that can disconnect a customer's power connection remotely from the server if the customer fails to pay their bill on time.

Key Takeaways

Automatic power cut-off systems disconnect electricity either for safety, overload, or non-payment, using IoT-enabled devices or mechanical triggers. IoT-Based Automatic Cut-Off Systems Modern distribution boxes and meters can be equipped with IoT-enabled controllers that monitor electricity consumption in real-time. These systems use embedded devices, such as NodeMCU ESP8266 microcontrollers, relays, and GSM modules, to automatically disconnect power when certain conditions are met, such as exceeding a consumption limit or non-payment of bills.

Users receive notifications via SMS or mobile apps before disconnection, and the system updates the central management database for billing and monitoring purposes. This approach also helps prevent electricity theft and meter tampering. Smart Electrical Panels IoT-enabled electrical panels, also called smart distribution boards, integrate sensors, communication modules, and edge computing to monitor voltage, current, temperature, and breaker status in real-time.

These panels can automatically cut off power in case of overloads, short circuits, or environmental hazards. They also allow remote monitoring and control, enabling utilities to proactively manage energy distribution and reduce downtime.

Meter Box Safety Devices

For maintenance and safety, meter box door-opening power-off devices are used. These devices automatically cut off power when the meter box door is opened, preventing electric shock during maintenance. They can operate via mechanical triggers, magnets, springs, or induction mechanisms, and may also include manual override switches for controlled operation.

Applications and Benefits

Safety: Prevents electric shock during maintenance or meter tampering. **Billing and Revenue Management:** Automatically disconnects power for non-payment, ensuring timely revenue collection. **Energy Efficiency:** Monitors consumption and prevents overloads, reducing energy waste.

Remote Control: Utilities can manage power distribution and respond to faults without on-site visits. Overall, automatic power cut-off systems combine safety, efficiency, and smart monitoring, ranging from simple mechanical devices to advanced IoT-enabled distribution boards, making electricity management more reliable and secure.
