Instructions for Use of Remote Monitoring Type Wiring Unit

Overview

Installation Instructions Remote MonitorThe Remote Monitor option provides operational status for 1-3 SPD up to 1000 feet away. The Remote Monitor requires.

Key Takeaways

Remote Monitoring Units (RMUs) require careful wiring, proper grounding, and correct configuration of inputs and outputs to ensure safe and reliable operation.General Safety Precautions

• Ensure all power lines are de-energized before starting installation to avoid electrical hazards .

• Only a qualified electrician should perform wiring, maintenance, or repairs .

• The unit's frame or enclosure must be solidly earthed to prevent electrical shock and ensure proper operation .

• Follow all relevant standards such as MIL-STD-202G for environmental and electrical testing .

Mounting and Physical Installation

• Mount the RMU in a secure, accessible location with sufficient clearance for wiring and ventilation .

• For DIN rail-mounted units (e.g., Netbiter EC310/EC350), ensure at least 1 inch (25.4 mm) clearance from other components .

• For cellular units, mount the antenna externally to avoid signal obstruction; drill a 0.63 in. (16 mm) hole for the antenna cord if required .

© 2026 ALFA PRO COMMUNICATION SYSTEMS (Pty) Ltd - All rights reserved

• Enclosures should be rated appropriately for the environment (e.g., Type 4X for industrial areas), .

Wiring Connections

• Power Supply: Connect the RMU to the designated low or high current power source as specified in the unit manual .

• Inputs/Outputs: Standard RMUs support General Purpose Inputs (GPIs) and Outputs (GPOs). Map alarms or sensor signals to these inputs via the control system configuration .

• Communication: Connect the RMU to the monitoring system using the appropriate interface (e.g., SATCOM, RS-485, Ethernet, or cellular modem), .

• Sensor Connections: For temperature or RTD inputs, follow the terminal numbering and wiring sequence as indicated in the manual. Ensure proper identification of each sensor for accurate monitoring .

• Contactor Logic: If controlling high-current devices, integrate contactor logic and miniature circuit breakers to protect the RMU and connected equipment .

Configuration and Initialization

• Assign network addresses for each RMU or sensor module on the RS-485 or Ethernet network .

• Configure alarm thresholds and input mapping in the control or monitoring system (e.g., Star2M Web Portal for Sealite RMUs), .

• Verify bi-directional communication if the system supports remote control commands .

• Test all inputs, outputs, and communication links before commissioning.

Maintenance and Troubleshooting

• Regularly inspect wiring for loose connections, corrosion, or damage.

• Check LEDs or status indicators for communication activity and power status .

• Only perform repairs or modifications when the unit is powered down and isolated from the network .

• Document all wiring and configuration changes for future reference. By following these steps, the Remote Monitoring Unit can be safely installed, wired, and integrated into a control or monitoring system, ensuring reliable remote supervision and management of connected assets .
