Secondary status inspection of relay protection

Overview

The secondary injection test method is one of the most essential techniques in electrical protection systems, particularly for verifying the accuracy, calibration, and performance of protective relays and circuit breaker trip units. ERS provides turnkey solutions for maintaining and testing electromechanical, solid-state, and microprocessor-based relays, as well as IEC 61850 IEDs, relay panels, and distributed protection systems. These are not repeated unless incorrect operation occurs. Most frequently they are performed by simulating test conditions by means of portable test sets. Other methods include : tests using. The new generation of intelligent substations has achieved online monitoring functions for secondary equipment, making some state variables of relay protection equipment become observable indicators.
