What does trough-type cable tray represent

Overview

When we talk about cable trays, we''re usually thinking about open or semi-open structures that hold and guide cables.

Key Takeaways

A trough-type cable tray is a cable support system with a continuous or partially ventilated bottom and solid side rails, designed to provide continuous support for cables without the rungs found in ladder trays.Design and Structure

A trough-type cable tray features a continuous or partially ventilated bottom that supports cables along their entire length, while solid side rails provide structural strength and containment. Unlike ladder trays, it does not have transverse rungs, which makes it ideal for small-diameter cables such as control, instrumentation, and communication cables . The bottom may be perforated to allow some airflow, improving heat dissipation, or solid for additional protection .

Function and Advantages

Trough trays are designed to emphasize continuous cable support while maintaining moderate structural strength. This design reduces mechanical stress on cable jackets and prevents sagging, which is particularly important for delicate or flexible cables . They occupy a middle ground between ladder trays, which offer excellent ventilation but less continuous support, and solid-bottom trays, which provide maximum protection but limited airflow .

Typical Applications

© 2026 ALFA PRO COMMUNICATION SYSTEMS (Pty) Ltd - All rights reserved

Trough-type cable trays are commonly used in industrial and commercial settings where a combination of cable protection and support is needed. They are suitable for mixed cable systems, including power, control, and communication lines, and are often selected when moderate protection and continuous support are required without the need for full enclosure . They are also easier to install and maintain compared to fully enclosed solid-bottom trays.

Comparison with Other Tray Types
• Ladder Tray: Open design with rungs; excellent ventilation but less continuous support.

• Solid-Bottom Tray: Fully enclosed; maximum protection against dust, moisture, and EMI but poor heat dissipation.

• Trough Tray: Continuous support with moderate protection; can be perforated for ventilation, balancing support and airflow . In summary, a trough-type cable tray provides a practical solution for supporting and organizing cables, offering continuous support and moderate protection, making it ideal for small-diameter or mixed cable installations in environments where both support and some airflow are important.
