What is the fiber optic cable plugged into a router called

Overview

The fiber optic cable does not plug directly into a standard home router because the signal type must be translated.

Key Takeaways

The fiber optic cable used for a router is generally called a fiber-optic internet cable, often single-mode or multi-mode, typically connecting to an ONT or optical network device rather than directly to a consumer router.Overview

A fiber optic cable is a network cable that transmits data as light pulses through glass or plastic fibers, offering high-speed, low-latency connections with minimal interference compared to copper Ethernet cables . These cables are commonly used by ISPs to deliver internet to homes and offices.

Types of Fiber Optic Cables
• Single-Mode Fiber (SMF): Designed for long-distance transmission with minimal interference, often used in GPON or XGPON networks. It has a small core diameter and can carry signals over several kilometers .

• Multi-Mode Fiber (MMF): Used for shorter distances, such as within a building or home network. It has a larger core and supports multiple light paths, suitable for connecting routers to nearby devices .
Connectors and Compatibility

Fiber optic cables use specialized connectors such as SC-APC, LC, or ST, which are not directly compatible with standard consumer routers . Typically, the fiber cable connects to an ONT (Optical Network Terminal) or ONR (Optical Network Router) provided by the ISP, which then converts the optical signal to Ethernet (RJ45) for your router . Consumer routers usually cannot accept a fiber optic cable directly unless they have a compatible SFP/SFP+ module and the ISP supports it.

Practical Considerations
• Adapters: SC-APC to RJ45 adapters do not exist because fiber and Ethernet use different protocols; a media converter cannot directly translate GPON signals to Ethernet .

• Cable Grades: For multi-mode fiber, OM3 and OM4 are preferred for higher speeds; for single-mode fiber, OS1 is suitable for indoor use and OS2 for outdoor applications .

• Installation: Fiber cables are sensitive to bending and require careful handling to avoid attenuation or microfractures . In summary, the fiber optic cable for a router is generally referred to as a fiber-optic internet cable, and it usually connects to an ISP-provided ONT or optical network device, which then interfaces with your router via Ethernet. The type (single-mode or multi-mode) and connector (SC-APC, LC, etc.) depend on the ISP's infrastructure and the distance of the connection.
