Which aggregation methods do Netgear switches support

Overview

What are Link Aggregation Groups (LAGs) and how do Link aggregation lets a switch treat multiple physical links between two endpoints as a single Link aggr.

Key Takeaways

Netgear switches support both static link aggregation and dynamic link aggregation using LACP (IEEE 802.3ad), often referred to as port trunking.Supported Aggregation Methods

1. Static Link Aggregation (Manual LAGs) Netgear switches allow you to manually configure multiple ports to form a single logical link, known as a static LAG. This method does not rely on negotiation protocols and requires the administrator to configure both ends of the connection. Static LAGs provide increased bandwidth and redundancy but lack automatic failover negotiation . 2. Dynamic Link Aggregation (LACP) Dynamic LAGs use the Link Aggregation Control Protocol (LACP, IEEE 802.3ad) to automatically negotiate and manage aggregated links between devices. If one physical link fails, traffic is dynamically redistributed across the remaining active links, maintaining connectivity without manual intervention . LACP is supported on Insight Managed switches, Smart Managed switches like the GS110TP, and higher-end models such as the MS510TX .

Practical Considerations
• Port Limits: Many Netgear switches allow multiple ports to be aggregated in a single LAG. For example, some models support up to 8 ports per LAG, while others like the GS748T support up to 10 static LAGs simultaneously .

• Port Compatibility: Only similar port types can be aggregated (e.g., 1G ports with 1G ports, 10G with 10G). Mixed-speed aggregation is not supported .

• Throughput Behavior: Aggregation increases total available bandwidth across the LAG, but individual connections between a single workstation and server remain limited to the speed of one port. Multiple clients or flows are required to fully utilize the aggregated bandwidth .

• Configuration Tools: LAGs can be configured via the web-based GUI, Smart Control Center, or the NETGEAR Insight mobile app, depending on the switch model .
Summary

Netgear switches provide flexible aggregation options to enhance network performance and reliability. Static LAGs are simple to configure but require manual setup, while dynamic LAGs using LACP offer automatic negotiation and failover. Administrators should consider port limits, compatibility, and traffic patterns to optimize throughput when deploying link aggregation.
