

High-density cold aisle in operations and maintenance data center

Overview

Hot aisle containment (HAC) isolates server exhaust; cold aisle containment (CAC) concentrates chilled supply air at server intakes. The right choice depends on rack density, existing infrastructure, and facility layout. While these concepts are not new, their successful implementation requires detailed planning, precise engineering, and thorough analysis to deliver maximum efficiency. As compute density rises, containment directly affects energy efficiency, increasing effectiveness, and improve overall operational performance. Below are some key takeaways, rationale, and requirements for implementing the evolving needs & configurations of colocation. Cold aisle containment is a crucial strategy in data center management. This strategy ensures that cool air is delivered.
