

How to connect fiber optic cables and PoE switches

Overview

Set your fiber optic-to-Ethernet converter box in a location near your Ethernet switch and plug in its power adapter.

Key Takeaways

PoE switches can be connected over long distances using fiber optic cables via SFP modules, media converters, or FiberPoE devices to maintain both data integrity and power delivery. Using SFP Modules in PoE Switches

If your PoE switch has a built-in SFP slot, the simplest method is to use an SFP module:

- Insert the SFP module into the switch's SFP slot.
- Remove the dust cap and connect the fiber optic cable to the module.
- Repeat the process on the second switch to complete the fiber link. This method allows direct fiber-to-fiber connections between switches, supporting long-distance data transmission without signal degradation .

Using Media Converters

When one or both switches lack SFP slots, media converters are required to convert electrical Ethernet signals to optical signals and vice versa:

- One side without SFP: Install a media converter with an SFP module, connect the fiber cable, and link the converter to the PoE switch via Ethernet patch cable.

- Both sides without SFP: Use two media converters, each with an SFP module, connected by fiber, and then link each converter to its respective PoE switch using Ethernet cables . Media converters are ideal for extending PoE networks beyond the 100-meter copper limitation while maintaining power delivery to devices .
Using FiberPoE Devices

For outdoor or long-distance deployments, FiberPoE devices provide a robust solution:

- They convert fiber to Ethernet and inject DC power for passive PoE.
- Can be used as a Fiber-to-Ethernet converter or as a Fiber Bridge for long runs.
- Offer protection against EMI and ESD, ensuring data integrity over distances exceeding 100 meters, which is the limit for standard copper PoE cabling . FiberPoE devices support Gigabit SFP modules and can deliver 24V or 50V power, making them suitable for powering remote PoE devices like cameras or access points.

Practical Considerations

- Distance: Standard PoE over copper is limited to 100 meters; fiber can extend connections up to several kilometers depending on fiber type and equipment.
- Power Delivery: Fiber itself cannot carry electrical power, so PoE must be delivered via copper at the remote end or through FiberPoE devices.
- Redundancy: Dual fiber ports or daisy-chaining with PoE media converters can provide redundancy and support multiple devices along a fiber route .
- Cable Type: Single-mode fiber is preferred for long distances, while multi-mode fiber is suitable for shorter runs. By combining SFP modules, media converters, or FiberPoE devices, network designers can extend PoE networks efficiently, maintain high data integrity, and power remote devices over fiber optic links.
