

How to connect four switches with fiber optic cables

Product Wiring Diagram

Overview

You can stack up to 4 units in a stack with a total of 208 ports managed as a single system with hardware failover.

Key Takeaways

Four switches can be connected using fiber optic cables in either a star or ring topology, depending on performance and redundancy requirements.

Topology Options

Star Topology: In a star configuration, all switches connect to a central core switch. Each switch has a dedicated fiber link to the core, which simplifies management and reduces the risk of cascading failures. This setup is high-performing because data collisions are minimized, and fiber can handle large bandwidths without congestion.

For four switches, each would require its own fiber strand or pair to the central switch. **Ring Topology:** A ring connects each switch to two others, forming a closed loop. This provides redundancy because if one link fails, data can travel the opposite direction to reach its destination.

Ring topologies are often used in industrial or enterprise networks where uptime is critical, but they require ring protection protocols to prevent broadcast storms.

Cabling and Connectors

Fiber Type: For distances under 550 meters at 1 Gbps, multimode fiber (OM2 or higher) is sufficient. For longer distances or 10 Gbps speeds, OM3/OM4 multimode or single-mode fiber may be required. **Connectors:** LC connectors are commonly used for high-density applications, while SC, ST, or MTP/MPO connectors may be used depending on switch ports and deployment environment.

Strand Requirements: Each fiber link typically uses a pair of strands (one for transmit, one for receive). For four switches in a star, you would need four pairs connecting to the core switch. **Switch Configuration SFP Modules:** Ensure each switch has compatible SFP or SFP+ transceivers for the fiber type and speed you plan to use.

Stacking or Hybrid Mode: Some switches support stacking via SFP ports, allowing multiple switches to be managed as a single system. For mixed models, hybrid stack mode may be necessary. **Redundancy Considerations:** In a star, failure of the core switch affects all connected switches.

In a ring, a single link failure does not disrupt the network, but proper protocols must be configured to prevent loops.

Recommendations

For simplicity and performance, a star topology with a central core switch is ideal for four switches. For redundancy and uptime, consider a ring topology with ring protection protocols.

Use L

C multimode fiber for short distances and ensure SFP modules match the fiber type and speed. Plan fiber strands carefully to avoid running out of capacity, especially if future expansion is expected. By selecting the appropriate topology, fiber type, and SFP modules, you can achieve a high-speed, reliable interconnection for your four switches.
