

Introduction to the Functions of Fiber Optic Cables

Overview

There are two types of fiber-optic cables: SMF and MMF. SMF is ideal for long-distance communication. Regardless of type, fiber-optic cables provide faster data transfer and support a wide range of. A fiber-optic cable uses long, thin strings of flexible glass to transmit data in the form of light. Where traditional copper cables max out at about 10 gigabits per second, fiber optic cables can handle 100 gigabits per second with commercially available hardware, and. Welcome to the Fiber Optic Cables Introduction Guide, your essential resource for navigating fiber optic technology. The fiber which is used for optical communication is waveguides made of. Nothing has changed the world of communications as much as the development and implementation of optical fiber. This article provides the basic principles needed to work with this technology. Most are roughly the diameter of a human hair, and. Increased bandwidth: The high signal bandwidth of optical fibers provides significantly greater information carrying capacity. Typical bandwidths for multimode (MM) fibers are between 200 and 600MHz-km and >10GHz-km for single mode (SM) fibers.
