Key Takeaways

Ji Zhen's work in relay protection focuses on applying mathematical morphology to improve the accuracy, speed, and reliability of power system protective relays.

Overview of Ji Zhen's Contributions Ji Zhen, along with colleagues Q. H.

Wu and Zhen Lu, has contributed to the development of novel protective relaying algorithms for power systems using Mathematical Morphology (MM), a nonlinear signal processing technique derived from set theory and geometry. Unlike traditional integral transform methods such as Fourier or wavelet transforms, MM operates directly in the time domain, allowing for precise extraction of signal features without distortion, even for non-periodic transient signals.

Advantages of Mathematical Morphology in Relay Protection

Fast and Simple Calculations: MM avoids complex multiplication and division operations, enabling real-time processing.

Non-

Periodic Signal Handling: It is effective for transient signals that are not periodic, which are common during faults. **Small Sampling Window:** MM requires only a small portion of the signal for analysis, improving speed and responsiveness. **Accurate Feature Extraction:** The method reliably identifies waveform components, even in the presence of noise, DC offsets, or harmonic distortion.

Applications in Power System Protection

Ji Zhen's research applies MM to a variety of power system components, including:
Transmission Lines: Detecting faults and locating them accurately. Transformers: Identifying inrush currents and abnormal conditions. Buses: Ensuring reliable bus protection under distorted waveform conditions.

Ultra-High-Speed Protection: Enhancing relay response times for critical faults. The approach also addresses distorted waveform detection and compensation, which is essential for the operation of many conventional relays.

Practical Impact

The MM-based relay protection algorithms developed by Ji Zhen and colleagues aim to create a next generation of protective relays that are faster, more reliable, and more accurate than traditional relays. This work is particularly valuable for engineers, researchers, and postgraduates working in power system protection and signal processing. In summary, Ji Zhen's contributions integrate advanced mathematical techniques into practical relay protection, improving fault detection, system reliability, and operational safety in modern power networks.
