

Key Points for Fire Prevention Inspection of Distribution Boxes

Overview

Summary of Key Points for Fire Hazard Inspection of Distribution Check if the distribution box is equipped with a screen guard baffle made of flame - retar.

Key Takeaways

Regular inspection, proper load management, fire-resistant installation, and environmental protection are essential for preventing fires in distribution boxes.

Inspection and Maintenance

Regular Inspection: Conduct routine checks to identify aging wiring, loose connections, overheating components, and insulation degradation. Use tools like infrared thermometers to monitor temperature anomalies in key parts of the distribution box (such as busbars and circuit breakers) to prevent fire hazards.

Cleaning and Moisture Control: Ensure the interior of the distribution box is free from dust, water droplets, and other contaminants.

Install rain covers for outdoor boxes and elevate basement units to prevent water intrusion. **Equipment Condition:** Verify that all switches, circuit breakers, and transformers are in good working order and comply with manufacturer specifications.

Load Management

Prevent Overloading: Avoid connecting too many high-power appliances to a single distribution box. **Install intelligent power-limiting devices** that automatically trip when current exceeds safe levels. **Monitor Aging Wiring:** Replace wires and cables that show signs of wear or insulation deterioration to reduce the risk of short circuits and overheating.

Fire-

Resistant Installation

Building Standards: High-voltage distribution rooms should be constructed with class I or II fire-resistant materials, while low-voltage rooms should meet at least level III fire resistance. **Partitioning and Spacing:** Install partitions between oil-filled equipment and maintain safe distances (at least 1 meter) between high- and low-voltage devices to prevent fire spread. **Sealing Penetrations:** Ensure that cable, busbar, and ventilation pipe penetrations through walls, floors, or ceilings are sealed with refractory materials to prevent fire propagation.

Environmental and Safety Measures
Fire-Fighting Equipment: Equip distribution rooms with fire extinguishers, sprinklers, and other firefighting tools appropriate for electrical fires. **Moisture and Pest Protection:** Install waterproofing, rainproofing, and pest-proofing measures to prevent insulation damage and short circuits. **Clear Surroundings:** Maintain at least 1 meter of clearance around distribution boxes, keeping flammable materials away and ensuring proper ventilation and emergency access.

Operational Safety

Professional Handling: Only qualified personnel should operate or maintain distribution boxes. Unauthorized access or wet-tool contact with live parts can trigger electrical fires. **Documentation and Monitoring:** Maintain inspection logs and monitor the operational status of protective devices to ensure compliance and early detection of potential hazards.

By following these key points, distribution boxes can be maintained safely, reducing the risk of electrical fires and ensuring reliable operation of the power system.
