

Optical Interface Disk and Optical Interface Module

Overview

Optical Interface Modules and Optical Interface Module LED Card This chapter describes the optical interface module (OIM) cards and optical interface module.

Key Takeaways

Optical Interface Modules (OIMs) are passive devices that manage fiber connections within multishelf network systems, while optical modules are hot-pluggable transceivers enabling high-bandwidth optical communication. Optical Interface Module (OIM) An Optical Interface Module (OIM) is a card used in multishelf network systems to interconnect fabric cards (FCCs) and line cards (LCCs) via optical fiber arrays. Key characteristics include: Passive device: OIMs do not actively process signals but provide fiber cross-connect functionality.

Connector arrays: Each OIM card typically has multiple connectors (e.g., 9 per card) and interfaces with fabric cards through internal connectors. Scalability: Up to 24 OIM cards can be installed in a multishelf system, with 2, 4, or 8 cards per chassis depending on configuration. Fiber distribution: OIMs distribute fibers from the fabric cables to ASICs on the system's switching fabric.

Bulkhead array adapters (BAAs): These terminate the fabric cables on the FCC side, ensuring organized and reliable fiber connections.

OI

Ms are often paired with OIM-LED cards, which provide visual status indicators for fiber connections and system health.

Optical Modules

An Optical Module is a hot-pluggable transceiver used for high-bandwidth data communication. Its main features include: Electrical and optical interfaces: The electrical side connects to the system's internal circuitry, while the optical side connects to fiber optic cables. Form factors: Common standards include SFP, SFP+, XFP, QSFP-DD, and OSFP, often defined by multi-source agreements (MSAs).

Active components: Optical modules contain lasers or LEDs for transmission and photodiodes for reception, sometimes integrated with digital signal processing (DSP) for high-speed links. Applications: Used in data centers, AI/ML networks, and high-performance computing to provide 400G, 800G, or higher bandwidth connections.

Relationship Between OI

Ms and Optical Modules While OIMs are passive and focus on fiber management within a chassis, optical modules actively convert electrical signals to optical signals and vice versa for external communication. In a multishelf system: OIMs organize and route fibers between internal cards. Optical modules connect the system to external fiber networks, enabling high-speed data transmission.

Together, they ensure efficient, scalable, and reliable optical connectivity in complex network infrastructures.
