

Optical Module v4

Overview

PROFIBUS OLM/G11 V4.0 06/2025, Operating Instructions, C79000-G8976-C749-02
Summary: This document contains information Siemens OLM P11 V4.0, OLM P12 V4.0.

Key Takeaways

Optical Module V4 refers to the fourth generation of optical modules, typically indicating an updated electrical interface standard, higher data rates, and improved performance in fiber-optic communication systems.

Overview of Optical Modules
An optical module is a hot-pluggable transceiver used in fiber-optic communication to convert electrical signals into optical signals and vice versa, operating at the physical layer of the OSI model . It usually consists of:

- TOSA (Transmitter Optical Sub-Assembly): Converts electrical signals into optical signals using a laser diode or LED .
 - ROSA (Receiver Optical Sub-Assembly): Converts incoming optical signals back into electrical signals using a photodetector .
 - Functional circuits and driver chips: Process signals for transmission and reception .
 - Optical and electrical interfaces: Connect the module to the fiber network and the host system . Optical modules are essential for high-bandwidth data communications and are widely used in networking equipment such as switches, routers, and servers.
- What "V4" Means

The "V4" designation generally refers to the fourth version or generation of the module's electrical interface standard. Over time, optical modules have evolved from analog NRZ interfaces to retimed digital interfaces, with each version improving:

- Data rates: Supporting higher bit rates for faster transmission.
 - Signal integrity: Reducing jitter and improving error performance.
 - Compatibility: Aligning with multi-source agreements (MSAs) and industry standards like the Common Electrical Interface (CEI) defined by the Optical Internetworking Forum (OIF), .
 - Power efficiency and thermal performance: Optimizing energy consumption and heat dissipation. For example, earlier versions (V1-V3) might support lower speeds or simpler electrical signaling, while V4 modules are designed for modern high-speed networks, often supporting 25G, 50G, or 100G Ethernet links.
- Practical Implications

Using a V4 optical module ensures:

- Compatibility with the latest high-speed network equipment.
- Improved reliability and signal quality over longer distances.
- Support for advanced features like forward error correction (FEC) and enhanced monitoring. In summary, V4 indicates a modern, high-performance generation of optical modules, reflecting improvements in electrical interface standards, data throughput, and overall efficiency in fiber-optic communication systems .
