Key Takeaways

The cost of an optical wavelength division multiplexer (WDM) ranges from a few hundred dollars for basic CWDM units to several thousand dollars for high-channel-count DWDM modules. Price Ranges

- Coarse WDM (CWDM): Typically used for short-distance enterprise or metro networks, CWDM multiplexers are more cost-effective. Prices generally start from \$200–\$500 per unit, depending on the number of channels and specifications .

- Dense WDM (DWDM): Designed for long-haul or high-capacity networks, DWDM modules are more expensive due to higher channel density, tighter wavelength spacing, and integration with optical amplifiers. Prices can range from \$1,000 to \$10,000 or more per module, especially for 40–160 channel systems .

Factors Affecting Cost

- Number of Channels: More channels increase complexity and cost. DWDM systems with 80–160 channels are significantly more expensive than 4–8 channel CWDM units .

- Channel Spacing and Bandwidth: Narrower spacing (e.g., 50 GHz vs 200 GHz) requires precise optics and increases cost .

- Optical Amplification: Modules paired with EDFAs or Raman amplifiers for long-distance transmission are more expensive .

- **Application Type:** Enterprise networks may use simpler CWDM units, while telecom carriers and data centers require high-performance DWDM systems .
- **Customization and Integration:** Factory customization, rack integration, and OEM branding can add to the price .

Summary

For planning purposes, CWDM multiplexers are generally under \$1,000, suitable for short-distance or lower-capacity networks, while DWDM multiplexers can cost several thousand dollars per unit, especially for high-channel-count, long-haul, or amplified systems. Prices vary based on channel count, spacing, amplification, and network requirements .
