

Selection of Red Light Source for Oil Pipeline Monitoring

Overview

Our solution FOpipe for oil and gas pipeline monitoring is offered to provide a response to these challenges.

Key Takeaways

Choosing the right red light source is critical for reliable fiber-optic pipeline monitoring, ensuring optimal signal strength, penetration, and compatibility with distributed sensing systems.

Key Considerations for Red Light Source Selection

1. **Wavelength Compatibility** Red light sources typically operate in the 620–750 nm range. For fiber-optic pipeline monitoring, the wavelength must match the sensitivity of the fiber and the detection system. Distributed Acoustic Sensing (DAS), Distributed Temperature Sensing (DTS), and Distributed Temperature and Strain Sensing (DTSS) systems often use specific wavelengths to optimize Rayleigh, Raman, or Brillouin scattering signals, which are essential for detecting leaks, strain, or temperature changes along pipelines .

2. **Coherence and Spectral Width** The coherence length of the light source affects the resolution and accuracy of the sensing system. Narrow-linewidth lasers provide high coherence, improving the detection of small vibrations or strain changes, while broader-spectrum LEDs may be sufficient for temperature sensing but offer lower spatial resolution .

3. **Power Output and Signal Penetration** High optical power ensures that the signal can travel long distances along the fiber without significant attenuation. For pipelines extending tens of kilometers, a red light source with sufficient output power is necessary to maintain signal integrity and reliable detection of anomalies .

4. **Stability and Reliability** Pipeline monitoring systems operate continuously in harsh environments. The light source must maintain stable output over time and temperature variations to prevent false alarms or signal drift. Solid-state lasers or high-quality LEDs are preferred for long-term reliability .

5. **Integration with Distributed Sensing Systems** The red light source must be compatible with the interrogator and detection system. For example, systems like FEBUS FOpipe or SLB Optiq™ integrate DAS, DTS, and DTSS technologies, requiring light sources that match the system's optical specifications for accurate real-time monitoring and geolocation of events .

6. **Safety and Environmental Considerations** Red light sources should comply with safety standards for optical radiation, especially in field installations. Additionally, the source should withstand environmental factors such as temperature extremes, vibration, and humidity commonly encountered along oil pipelines .

Practical Recommendations

- Use narrow-linewidth red lasers for high-resolution DAS applications to detect acoustic events or third-party intrusions.
- Select LEDs or broader-spectrum sources for temperature-only monitoring where spatial resolution is less critical.
- Ensure wavelength alignment with the fiber type and scattering mechanism (Rayleigh, Raman, Brillouin) used in the monitoring system.
- Verify long-term stability and environmental robustness to minimize maintenance and false alarms.
- Coordinate with system providers (e.g., FEBUS, OptaSense, SLB) to ensure the light source is optimized for the specific pipeline monitoring platform . By carefully considering these factors, operators can achieve accurate, reliable, and long-range monitoring of oil pipelines, enhancing safety, leak detection, and operational efficiency.

Article Content

Selection of Red Light Source for Oil Pipeline Monitoring

This application note explores the deployment of Resensys wireless monitoring technology for oil and gas pipelines, offering a cost

Pipeline Monitoring Sensors for Leak Detection & Safety

Complete guide to pipeline monitoring sensors and leak detection systems for oil and gas pipelines. Learn real-time

Real-Time Pipeline Monitoring and Threat Detection

These solutions help operators detect leaks, monitor ground movement, identify intrusion and third-party

Pipeline Monitoring and Leak Detection: Essential Technologies and ...

By monitoring changes in the backscattered light, the system can detect acoustic vibrations along the pipeline, which

Pipeline Integrity Monitoring and Leak Detection | SLB

Using the latest fiber-optic sensing technology for pinpoint accuracy and continuous 24/7 real-time monitoring, our pipeline integrity

Oil and Gas Pipeline Monitoring | Paulsson

Our sensor technologies are perfect for monitoring Oil, Natural Gas (NG) which includes, Methane (CH₄), Green Hydrogen (GH₂),

Multi-Parameter Fiber Optic Monitoring for Oil and Gas Pipelines

Opportunity Monitoring the integrity of pipelines, power grids and other range, and typically measure only a single parameter at a

A comprehensive survey on pipeline monitoring technologies ...

By focusing on pipeline monitoring key considerations, monitoring technologies comparison, market opportunities, industrial

Oil and gas pipeline monitoring | pipeline surveillance | FEBUS

Our solution FOpipe for oil and gas pipeline monitoring is offered to provide a response to these challenges. It comes with

Leakage detection techniques for oil and gas pipelines: State-of-the ...

This paper introduces the existing detection methods that can be used in oil and gas pipelines, and analyzes their

Pipeline Integrity Monitoring and Leak Detection | SLB

Pipeline integrity monitoring systems SLB's pipeline integrity monitoring systems—part of the Optiq™ fiber-optic solutions

Advances in intelligent identification of fiber-optic vibration signals ...

Based on the principles and characteristics of distributed fiber optic monitoring technology, this paper introduces the

Systematic literature review and bibliometric analysis of pipeline ...

To mitigate these threats, several techniques have been proposed. This systematic review analysed the various

A Real-Time, Non-Contact Method for In-Line Inspection of Oil ...

The real-time inspection of oil and gas pipelines is extremely vital to mitigate accidents and maintenance cost as well

Application and Cases of Pipeline Inspection and Monitoring

This chapter introduces several inspection and monitoring cases in actual projects, including CCTV inspection,

An intelligent optical fiber-based prewarning system for oil and gas ...

The recognition rate of this method in the actual oil and gas pipeline is greater than 98%, and the recognition speed of a

Recent Advances in Pipeline Monitoring and Oil Leakage Detection ...

In order to avoid such menace and maintain safe and reliable pipeline infrastructure, substantial research efforts have been devoted

Small unmanned airborne systems to support oil and gas pipeline ...

Oil and gas transmission pipelines require monitoring for maintenance and safety, to prevent equipment failure and

A review of pipeline monitoring and periodic inspection methods

THE SAFETY AND RELIABILITY of gas and oil pipeline systems are dependent upon the effectiveness of current

Recent Advances in Pipelines Monitoring and Oil Leakage

50 Based on this statistics, incidents of pipeline leakage are hard to entirely avoid as the sources of 51 failures are diverse. However,
