

Specifications and Models of Fiber Optic Cable Trays for Computer Rooms

Overview

Our Fiber Cable Tray System designed to route and protect fiber optic and high-performance copper cabling to or from network cabinets, distribution frames or other devices.

Key Takeaways

Fiber optic cable trays in computer rooms are designed to safely route and protect optical cables, with specifications based on tray type, width, density, support hardware, and compliance with NEC standards.

Tray Types and Materials

Fiber optic cable trays are available in several types, including ladder, trough, channel, and solid-bottom trays, each with at least one open face for cable access. Materials are typically halogen-free, flame-retardant plastics (PC-ABS) or metal, rated UL 94 V-0 for fire safety. Some trays feature snap-on or hinged covers for easy access and protection.

Tray Widths and Density
5-inch trays: Suitable for low-density fiber routing in confined spaces, such as small telecom rooms or equipment connections.
10-inch trays: Support moderate fiber density, accommodating multiple fiber bundles with room for future growth.
15-inch trays: Designed for high-density backbone routing in data centers or main distribution areas, providing maximum capacity and scalability.

Cable Compatibility and Ratings

Fiber optic cables installed in trays must comply with NEC Article 770, which permits cables with listings such as OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC. If trays are installed in plenum areas, cables must also be plenum-rated. Tray-rated fiber optic cables are designed to withstand pulling, impact, and harsh temperatures, with tight-buffered designs for easier terminations and improved bend radius management.

Support and Hardware

Proper support is critical for maintaining cable integrity. Fiber tray systems include ladder racks, ceiling mounts, floor mounts, cabinet standoffs, and adjustable support kits. These ensure correct spacing, stability, and compliance with recommended support intervals.

Fiber tray drops allow vertical transitions from overhead trays to racks or cabinets while protecting the cable bend radius. Installation Considerations Tool-less installation: Many modern trays allow snap-on covers and quick exits for easy deployment. Bend radius management: Trays and drops are designed to prevent excessive bending, which can degrade signal quality.

Modular components: Side exits, 90-degree bends, and straight channels enable flexible routing throughout the computer room. Environmental durability: Tray-rated cables are built to resist mechanical stress, temperature variations, and potential impacts during installation.

Summary

When designing fiber optic cable trays for computer rooms, consider tray type, width, cable density, support hardware, and NEC compliance. Use plenum-rated cables in air-handling spaces, maintain proper bend radius, and select modular, tool-less trays for flexibility and future expansion. These specifications ensure reliable, safe, and scalable fiber management in data centers and telecom rooms.
