

Standard value for temperature accuracy of temperature sensing optical cable

Overview

In this article, the manual calibration approach was developed using the model-independent Parameters Estimation (PEST), together with the external temperature sensors as references for the DTS system.

Key Takeaways

Fiber optic temperature sensing systems, including DTS and FBG-based sensors, typically achieve temperature accuracies ranging from $\pm 0.1^\circ\text{C}$ to $\pm 1^\circ\text{C}$ depending on technology, calibration, and environmental conditions. Distributed Temperature Sensing (DTS) Accuracy DTS systems use standard optical fibers to measure temperature along the cable length, often over tens of kilometers, with spatial resolutions down to one meter.

Raman-based DT

S systems determine temperature by analyzing the ratio of Stokes and anti-Stokes backscattered light. Typical temperature accuracy for Raman DTS systems is in the range of $\pm 1^\circ\text{C}$, with temperature resolution (ability to detect small changes) often better than 0.1°C over short distances.

Enhanced DT

S systems, such as those combining Distributed Acoustic Sensing (DAS) with DTS, can improve response time and resolution, particularly for long-distance monitoring (>50 km) in applications like power cable or pipeline monitoring. Fiber Bragg Grating (FBG) Sensors FBG sensors are point-based or multiplexed along a single fiber and measure temperature by detecting shifts in reflected wavelength caused by thermal expansion of the fiber core. Typical wavelength accuracy is around 5 pm, corresponding to a temperature accuracy of $\pm 0.1^\circ\text{C}$ to $\pm 0.5^\circ\text{C}$, depending on calibration and environmental conditions.

FB

Gs offer high spatial resolution and are suitable for high-definition temperature mapping over short to medium distances (up to several hundred meters per channel) with fast measurement frequencies (up to 6 kHz). Fluorescent Point Sensors Fluorescent-based optical fiber sensors measure temperature at a single point by detecting the decay time of a fluorescent material excited by a light source. These sensors are highly stable, immune to electromagnetic interference, and provide calibration-free, accurate readings with long-term reliability.

Accuracy is typically within $\pm 0.1^\circ\text{C}$, making them suitable for critical applications such as transformer hot-spot monitoring.

Standards and Guidelines

While there is no single universal standard for all fiber optic temperature sensors, multiple organizations provide guidance: IEEE, IEC, ASTM, ISHMII, SEAFOM, and SAE have developed standards for fiber optic sensors, covering performance, calibration, and environmental testing. Standards address accuracy, spatial resolution, response time, and environmental robustness, ensuring that developers and users can compare and implement fiber optic temperature sensing systems reliably. Users are advised to consult specific standards documents for detailed requirements, as these are often organization-specific and may need to be purchased from the respective standards body.

Practical Considerations

Environmental factors such as temperature extremes, mechanical stress, and electromagnetic interference can affect accuracy; protective coatings and proper installation mitigate these effects. Calibration is essential for achieving the stated accuracy, particularly for long-distance DTS systems or multiplexed FBG arrays. Application-specific selection: Raman DTS is preferred for long-distance monitoring, FBGs for high-resolution multipoint sensing, and fluorescent sensors for critical single-point measurements.

In summary, temperature sensing optical cables can achieve accuracies from $\pm 0.1^{\circ}\text{C}$ to $\pm 1^{\circ}\text{C}$, depending on the sensing technology, calibration, and environmental conditions, with standards provided by IEEE, IEC, ASTM, and other organizations to guide performance and implementation.

Article Content

Distributed Sensing Cable in Industrial Environments

Imagine being able to continuously, accurately, and in real-time detect small acoustic, temperature, and/or strain changes anywhere along an optical cable in

A Dynamic Calibration of Optical Fiber DTS Measurements Using

In this article, the manual calibration approach was developed using the model-independent Parameters Estimation (PEST), together with the external temperature sensors as references for the DTS system.

Distributed temperature sensing

Temperatures are recorded along the optical sensor cable, thus not at points, but as a continuous profile. A high accuracy of temperature determination is achieved over great distances. Typically the

Optical Temperature Sensors: Complete Technical Guide

The technology measures temperatures from -40°C to $+260^{\circ}\text{C}$ with $\pm 1^{\circ}\text{C}$ system accuracy using robust fiber optic cables extending up to 80 meters from electronics to sensing points.

Temperature Measurement Using Optical Fiber Methods: Overview

The paper deals with the overview of fiber optic methods suitable for temperature measurement and monitoring. The aim is to evaluate the current research of temperature

Internal temperature measurement and conductor temperature

The conductor temperatures were calculated using the temperatures measured by the fibers at the insulation shield surface and waterproof compound center, and the differences between

Temperature and Humidity Stability of Fibre Optic Sensor Cables for ...

To investigate this aspect, fibre optic cables commonly used for strain (three tight-buffered cables) or temperature (two loose-buffered cables) measurement were considered.

Design And Prediction Of Temperature-Strain Relationships In Fiber ...

In this paper, the FBG sensor is designed to measure strain and temperature for a given interval of time. The calibration factor of 10.04 pm/°C for temperature and 1.22 pm/με for strain, is

Distributed Temperature Sensing: Review of Technology and

Distributed Temperature Sensing: Review of Technology and Applications Abhisek Ukil, Senior Member, IEEE, Hubert Braendle, and Peter Krippner Abstract—Distributed temperature sensors (DTS)

Distributed temperature sensing

Distributed temperature sensing systems (DTS) are optoelectronic devices which measure temperatures by means of optical fibres functioning as linear sensors. Temperatures are recorded along the optical

Optical Temperature Sensors – fiber Bragg gratings, point sensors ...

A distributed temperature sensor uses a standard optical fiber as a continuous sensing element. By launching light pulses and analyzing the naturally occurring back-scattered light (e.g., Raman or

Optical Fiber Sensors for High-Temperature Monitoring: A Review

High-temperature measurements above 1000 °C are critical in harsh environments such as aerospace, metallurgy, fossil fuel, and power production. Fiber-optic high-temperature sensors are

DTSX3000 Distributed Temperature Sensor

What Is Distributed Temperature Sensing? Distributed temperature sensing (DTS) measures temperature distribution over the length of an optical fiber cable using

Temperature and Humidity Stability of Fibre Optic Sensor Cables for ...

Fibre optic sensors offer a means for the real-time continuous measurement of temperature or strain in concrete structures. Backscattered light along a fibre optic sensing (FOS)
