

Terminal Box Fiber Optic Cable Connection Method

Overview

Inside the fiber optic cable terminal box, fiber optic cables entering the termination box can contain multiple cores.

Key Takeaways

Fiber optic terminal boxes connect incoming fiber cables to pigtails or patch cords through splicing or connectorized methods, ensuring organized, protected, and low-loss signal distribution. Overview of Fiber Termination Boxes

A Fiber Termination Box (FTB), also called an Optical Terminal Box (OTB), is a compact enclosure designed to terminate, splice, and manage fiber optic cables. It serves as a junction between incoming feeder cables and outgoing pigtails or patch cords, providing a secure and organized interface for network distribution. FTBs can be wall-mounted, rack-mounted, or outdoor-rated, depending on the installation environment.

Fiber Connection Methods1. Fusion Splicing

Fusion splicing is the most common method for connecting fibers in a terminal box. The process involves:

- Preparing the fiber ends by stripping the protective coating and cleaning the bare fiber.
- Aligning the fibers in a fusion splicer to ensure precise core-to-core contact.
- Fusing the fibers using an electric arc, creating a permanent, low-loss joint.

- Placing the spliced fibers into splice trays within the FTB for protection and organization.
- Managing excess fiber by coiling it neatly in the tray to prevent bending or damage . Fusion splicing is preferred for long-distance or high-bandwidth networks because it minimizes signal loss and back reflection.

2. Mechanical Splicing

Mechanical splicing uses a precision alignment device to hold two fiber ends together. While easier to perform in the field, it generally has slightly higher insertion loss than fusion splicing. Mechanical splices are often used for temporary connections or in situations where fusion splicing equipment is unavailable .

3. Connectorized Termination

In some FTBs, fibers are terminated using pre-terminated pigtails with connectors such as:

- SC (Subscriber Connector): Simple push-pull design, widely used in FTTH networks.
- LC (Lucent Connector): Smaller form factor, suitable for high-density applications.
- ST (Straight Tip): Bayonet-style connector, commonly used in older installations . The fiber from the main cable is spliced to the pigtail inside the FTB, and the connectorized end is then plugged into patch panels or customer equipment. This method allows for easy reconfiguration and maintenance.

Installation Considerations

- Mounting: Ensure the FTB is accessible and aligned with cable entry points.
- Cable Entry: Use rubber diaphragms or grommets to protect fibers at entry points.
- Fiber Routing: Guide fibers through plastic posts or channels to prevent sharp bends.
- Splice Tray Management: Secure fibers with clamping straps and store excess fiber neatly.
- Cleanliness: Maintain clean fiber ends and connectors to prevent signal degradation .

Summary

The fiber optic connection in terminal boxes is achieved primarily through fusion splicing, mechanical splicing, or connectorized pigtails. Proper installation, careful fiber handling, and organized routing within the FTB are essential to maintain low signal loss, protect fibers from environmental damage, and ensure reliable network performance in FTTH and other fiber optic applications .
