

Tin-plated wires in distribution boxes

Overview

Tin-plated copper is the industry standard for industrial switchgear, renewable energy, and aluminum-compatible assemblies; offers 10-15 year lifespan with minimal maintenance at a modest cost premium. A plated wire is developed by plating a desired metal to the bare conductor metal in a variety of plating thicknesses, and then film insulating it depending on the application. Tin, silver, nickel and other pure metal coatings can be applied individually or as composites to improve conductor. The supplier offers three options: bare copper (the cheapest), tin-plated (mid-range), or silver-plated (premium). All carry the same rated current. So why would you ever pay more?

Three months after installation, you get a call: a connection joint is running hot. Wires inventoried include those meeting QQ-W-343, AA59551, Mil Std 1276, ASTM B298, ASTM B355, and ASTM B488 requirements. These wires were developed for applications where severe operating environments may degrade.
