

Trapezoidal cable trays can be used for low-voltage wiring in vertical shafts

Overview

Discover a professional 5-step guide on how to choose the right cable tray for low voltage system. Learn about types, sizing, standards for reliable installations.

Key Takeaways

Trapezoidal cable trays can be used for low-voltage wiring in vertical shafts if installed according to manufacturer guidelines and standard practices.

Suitability for Low-Voltage Wiring

Trapezoidal cable trays, often a type of ventilated trough or solid-bottom tray, are suitable for supporting low-voltage cables such as data, telecommunications, security, and control wiring. They provide mechanical support, maintain cable organization, and allow for proper ventilation to prevent heat buildup, which is critical for fiber optic and high-performance copper cables.

Vertical Installation Considerations

Vertical shaft installations are feasible for low-voltage systems, but certain factors must be addressed: Orientation: Cable trays can be installed vertically, sometimes referred to as “edge-wise” orientation. This minimizes dust accumulation and can be advantageous in industrial or clean environments. Support and Mounting: Vertical trays must be securely wall-mounted or single-hung, with supports spaced according to the tray's load rating and cable weight.

Cable Fill and Bend Radius: Ensure the tray accommodates the total cable weight and allows for the minimum bend radius, especially for fiber optics, to prevent signal degradation. **Compliance:** Installations must comply with NEC Article 392, which permits cable trays for low-voltage circuits, including communications and control cables, provided fill, support, and separation requirements are met.

Advantages of Trapezoidal Trays in Vertical Shafts

Dust and debris reduction due to sloped sides. Improved airflow for heat dissipation. Ease of cable management and future expansion, particularly for low-voltage systems.

Compatibility with multiple tiers for stacked or high-density cable runs. **Standards and Guidelines** IEC 61537 provides international guidance on mechanical strength, corrosion resistance, and installation compatibility for metallic cable trays, including vertical runs. Manufacturer specifications should always be consulted for vertical or non-standard orientations to ensure structural integrity and compliance with load ratings.

Summary

Trapezoidal cable trays are a viable option for low-voltage wiring in vertical shafts, offering mechanical support, ventilation, and dust mitigation. Proper installation requires attention to support spacing, cable fill, bend radius, and compliance with NEC and IEC standards. Always follow manufacturer guidelines for vertical orientation to ensure safety and long-term reliability.
