

What are the dimensions of vertical cable trays in low-voltage electrical shafts

Overview

Learn cable tray types, uses, and installation basics to support safe, efficient electrical and water supply pipe systems in your project.

Key Takeaways

Vertical cable trays for low-voltage shafts typically range from 50mm to 900mm in width and 50mm to 150mm in depth, with standard lengths of 3 meters per section.

Standard Widths and Depths

Vertical cable trays are designed to accommodate the number and type of cables while ensuring proper heat dissipation and compliance with electrical codes. Common widths for low-voltage applications range from 50mm to 900mm, with smaller widths used for control or signal cables and larger widths for power or bundled cables. The depth (or side rail height) typically ranges from 50mm to 150mm, which ensures cables remain securely in place and allows for adequate airflow.

Length and Material

Cable trays are usually manufactured in 3-meter (10-foot) sections, which balances ease of transport and installation. Material thickness varies depending on load requirements, with thicker trays supporting heavier cable bundles and longer spans.

Fill and Layer Considerations

For low-voltage installations, it is recommended to fill trays to no more than 40–50% of their capacity to prevent overheating and allow for future expansion . Ladder-type trays may allow single-layer or multi-layer cable arrangements, while solid-bottom trays reduce fill capacity slightly due to restricted airflow .

Compliance and Sizing Guidelines

Tray dimensions should comply with NEC, IEC 61537, and NEMA standards, which provide guidance on mechanical strength, ventilation, and cable fill ratios . The width is the primary factor for cable capacity, while depth influences vertical stacking and heat dissipation. Proper sizing ensures safe, maintainable, and code-compliant installations.

Summary

- Width: 50mm – 900mm
- Depth/Height: 50mm – 150mm
- Length per section: 3 meters
- Fill ratio: 40–50% for low-voltage cables
- Material thickness: Selected based on load and span requirements
- Standards: NEC, IEC 61537, NEMA These dimensions provide a practical starting point for designing vertical cable trays in low-voltage electrical shafts, ensuring safety, compliance, and future scalability.
